

## Refill Instructions for Candlestick Lighter

Here is an example of a **Butane Gas Refill** that is used to fill our lighter candle.

Tips on filling your lighter:

Set flame adjustment near (-) lowest position when refilling...

**Always read and follow manufacturer's instructions on your butane refill canister.**

Fill with the lighter in an upside-down position.

Put nozzle tip directly on valve opening as indicated by the butane refill canister.

Press down firmly on the canister 2-3 times in 2 second intervals.

Minimal butane discharge may occur with some lighters when filled.

Wait 2-5 minutes before attempting to ignite the lighter. This will allow enough time for excess butane to dissipate and the gas in the lighter to reach room temperature. Your lighter may not ignite until the butane has reached room temperature.

The Butane Gas refill can be purchased where cigarettes are sold or hardware stores as well as online - here is an example link:
